

Recobro Cost Model

Cost Model

Build: Recobro. Deterministic subrogation and recovery screener.

This project has no recurring cost. There is no always-on resource, so it costs nothing when idle and bills strictly per file. The cost model below records each billable component, its pricing basis, and its estimated cost at test volume, then identifies the design choices that control the bill.

Component | Pricing basis | Estimated cost per file

Claude Sonnet 4.5 (fact extraction and criteria assessment) | Per-call model usage (EU geo pricing) | ~\$0.02 per file (~\$0.12 for 6-file eval run)

Bedrock Guardrail | Per-unit cost (2 invocations per file) | Small per-unit cost

Lambda functions (2 masking, rules, compose) | Per invocation (4 per file) | \$0.00 (well within AWS free tier)

Fixed or standing costs | None | \$0.00

Assumptions: single-user testing volume (6 files), Claude Sonnet 4.5 on the Frankfurt regional endpoint (EU inference profile), and 2 model calls per file averaging roughly 4,000 input and 1,000 output tokens combined. Fact extraction uses 3,000 to 4,000 input tokens and up to 1,500 output tokens, while criteria assessment uses 1,000 to 1,500 input tokens and up to 2,000 output tokens. All costs are strictly per-invocation with no hourly or monthly minimum. Not included in this estimate is the earlier Sonnet 5 attempt that failed on an account-level access error, which incurred no usage cost because the call was rejected before reaching the model.

What this means in practice: a full evaluation run of 6 files costs roughly \$0.12 total (about \$0.02 per file). The screener costs nothing between runs because no resource carries an hourly or monthly standing floor.

The cost lever

Within the model cost, input and output token counts drive the overall spend. Bounding extraction and assessment prompts to structured operations keeps per-file token usage predictable and controls total execution cost.

Production cost shape

This project has no fixed floor and scales linearly per file processed, with costs falling to zero when idle.
